Padel Arena Website

Implementation Specification for Codex

Scope: Pages 1, 2, 3, 4, 5, 8, 10, 11, 12, and 13 from the product plan

Document type: product + UX + functional + technical handoff

Purpose

This document tells Codex exactly what to build, how each selected page should work, what data structures are needed, what business rules apply, and the acceptance criteria for release. The site must act as both a premium marketing website and a real booking platform.

1. Project Summary

Build a responsive web application for a padel arena with public brand pages, a full court booking flow, a customer account area, and an admin dashboard. The implementation must prioritize speed to book, mobile usability, clear pricing, and clean operations for staff.

Pages included in this phase

- 1. Home
- 2. About Us
- 3. Courts / Facilities
- 4. Booking
- 5. Pricing
- 8. Tournaments / Events
- 10. Contact Us
- 11. FAQ
- 12. User Account / My Bookings
- 13. Admin Dashboard

Primary success criteria

- A visitor can understand the venue and book a court with minimal friction.
- A customer can register, view, manage, and cancel bookings within policy limits.
- Admins can manage courts, time slots, prices, bookings, events, contact messages, and FAQs without touching code.
- The entire experience works well on mobile, tablet, and desktop.

Recommended stack

Layer	Recommendation	Notes
Frontend	Next.js + React + TypeScript	Fast routing, SEO-friendly public pages, shared server/client patterns
UI	Tailwind CSS + component library	Use reusable cards, forms, modals, and tables
Backend	Next.js API routes or Node/Express	REST endpoints are preferred for clarity

Layer	Recommendation	Notes
Database	PostgreSQL	Relational rules fit bookings, courts, prices, events, users
Auth	NextAuth or custom JWT/session auth	Must support customer and admin roles
Payments	Stripe or configurable placeholder	Design for pay-now or reserve-now/pay-at-venue modes

High-level information architecture

Navigation rule
The header must always expose the fastest path to booking. Every public page should include a visible "Book Now" CTA and link to the booking page. On mobile, a sticky bottom CTA is recommended.

2. Global Requirements

Brand and visual style

- Sports-premium visual direction: clean, energetic, modern, not overly flashy.
- Use strong photography, dark neutral surfaces, and one bright accent color for calls to action.
- Typography should be bold for headings and highly readable for body copy.

Responsive behavior

- Mobile-first implementation.
- Navigation collapses to hamburger on small screens.
- Cards stack vertically on mobile.
- Tables must become cards, accordions, or horizontally scrollable containers when needed.

Performance

- Optimize large images and use lazy loading for gallery-like sections.
- Booking page should not block rendering while loading all availability; fetch data asynchronously with loading skeletons.
- Avoid auto-playing heavy background video on mobile.

Accessibility

- All forms require labels, validation messaging, keyboard access, and clear focus states.
- Buttons and interactive controls must meet accessible contrast and touch target sizes.
- Use semantic landmarks: header, nav, main, footer, section, form.

Security

- Never trust availability or pricing calculations performed in the browser.
- Re-check slot availability, court status, and policy rules on the server before final booking confirmation.
- Admin pages must be protected by role checks on both client and server.

Shared layout

Area	Required behavior
Header	Logo, navigation links, Book Now CTA, Login or My Account button
Footer	Address, opening hours, phone, WhatsApp, email, quick links, social links, legal links
Breadcrumbs	Use on internal marketing pages except homepage
Global toast/alerts	Use for booking confirmations, errors, saved changes, and admin actions
Empty states	Every list view must have a designed empty state, not a blank page

3. Core Routes and Roles

Route	Audience	Purpose
/	Public	Homepage and main conversion entry
/about	Public	Brand story and trust page
/courts	Public	Facilities and court details
/booking	Public/Customer	Search availability and complete booking flow
/pricing	Public	Show rates, packages, add-ons, and rules

Route	Audience	Purpose
/events	Public	Tournament and event listing and details
/contact	Public	Inquiry, location, and contact channels
/faq	Public	Common answers and policies
/account	Customer	Profile + upcoming bookings overview
/account/bookings	Customer	Booking history and booking management
/admin	Admin	Operational dashboard overview

User roles

Role	Can do	Cannot do
Guest	Browse public pages, search slots, start booking, submit contact form	View personal bookings or enter admin tools
Customer	Book, pay, cancel/reschedule within rules, manage account	Access other users' data or admin tools
Admin	Manage all business data, bookings, availability, pricing, events, FAQ, messages	Use customer-only account views as the only management interface

4. Data Model - Minimum Required Entities

The database must be designed first because almost all pages rely on shared business data. The following entities are the minimum required for this phase.

Entity	Important fields	Used by pages
users	id, full_name, email, phone, password_hash, role, created_at	Booking, Account, Admin
courts	id, name, type, surface, indoor_outdoor, features_json, status, sort_order	Home, Courts, Booking, Admin
court_images	id, court_id, image_url, alt_text,	Home, Courts, Admin

Entity	Important fields	Used by pages
	sort_order	
pricing_rules	id, title, court_type, day_type, start_time, end_time, duration_mins, base_price, is_peak	Pricing, Booking, Admin
bookings	id, user_id nullable, guest_name, guest_email, court_id, booking_date, start_time, end_time, status, total_amount, payment_status, notes	Booking, Account, Admin
booking_addons	id, booking_id, addon_type, quantity, unit_price	Booking, Pricing, Admin
blocked_slots	id, court_id, booking_date, start_time, end_time, reason	Booking, Admin
events	id, title, slug, summary, description, start_datetime, end_datetime, location_text, capacity, image_url, registration_url, status	Home, Events, Admin
contact_messages	id, name, email, phone, subject, message, status, created_at	Contact, Admin
faq_items	id, category, question, answer, sort_order, is_active	FAQ, Admin
site_settings	id, key, value_json	Home, Contact, Footer, global settings

Booking status values

Status	Meaning
pending	Temporary state before payment or manual confirmation
confirmed	Active valid booking
cancelled	Booking cancelled by customer or admin
completed	Past booking that was used successfully
no_show	Past booking where player did not attend

Payment status values

Status	Meaning
unpaid	No payment captured yet
paid	Fully paid
partially_paid	Deposit or split payment only
refunded	Payment returned after cancellation
failed	Payment attempt failed

5. Business Rules

1. A court cannot be double-booked for overlapping time ranges on the same date.

2. A blocked slot acts exactly like an unavailable slot and must not be shown as bookable.

3. Price shown on the booking page is informative until the server validates the selected slot against active pricing rules.

4. Cancellation and rescheduling windows must be configurable in admin settings, for example: cancellation allowed until X hours before start time.

5. Guest booking may be enabled or disabled by configuration. If enabled, guest bookings still require email and phone.

6. If payment mode is pay-now, the selected slot should be held for a short checkout window, for example 5 to 10 minutes.

7. If a hold expires before payment succeeds, the slot must return to available state automatically.

8. Event records and FAQ records must support draft/inactive states so admins can prepare content before publishing.

> **Important implementation note**
> Booking availability must be generated from confirmed bookings plus active slot holds plus blocked slots. The browser may display optimistic availability, but the final source of truth must be the server.

6. Page Specification - Home (/)

Purpose

The homepage is the main sales page. It must make the venue look credible, tell the visitor what is offered, and surface a booking action immediately without forcing the user to search for it.

Content and layout

1. Hero section - Large heading, short supporting line, primary Book Now CTA, secondary CTA to Pricing or Courts, and strong hero image/video. Show location and a short value proposition.
2. Quick booking widget - Compact booking search with date, approximate time, duration, and court type filters. CTA routes to the booking page with query params.
3. Why choose us - 3 to 6 benefit cards such as premium courts, easy booking, parking, coaching availability, community events.
4. Courts preview - Cards summarizing total courts, court types, indoor/outdoor status, and key amenities with link to full courts page.
5. Pricing preview - Show starting price or sample price matrix with CTA to full pricing page.
6. Events preview - Show upcoming tournaments or social events with cards and link to events page.
7. Testimonials or social proof - Optional but recommended. Use real quotes or statistics such as weekly players, average rating, or tournaments hosted.
8. Location and contact strip - Map preview, opening hours, contact links, and CTA to contact page.
9. Final CTA band - Short booking message near footer to catch users who scrolled through the page.

Interactive behavior

- Book Now button goes directly to /booking.
- Quick booking widget passes the selected filters into the booking page URL.
- Home page cards should link to their full pages.
- If upcoming events exist, show the nearest 3 active published events sorted by start date.

Data requirements

- site_settings for hero text, featured stats, contact snippet
- featured courts or first few active courts
- pricing summary values or computed lowest published rate
- upcoming active events

- optional testimonials dataset or static content block

Implementation notes

- Do not make the homepage too text-heavy. This page should scan quickly.
- Hero must work without video; image fallback is required.
- All key CTAs should be above the fold on desktop and within the first screen on mobile.

Acceptance criteria

- A new visitor can understand what the arena offers in under 10 seconds.
- The primary CTA is visible immediately on desktop and mobile.
- Quick booking widget pre-fills the booking page correctly.

7. Page Specification - About Us (/about)

Purpose

The About page exists to create trust and brand identity. It should explain the arena story, standards, and what kind of player experience the business wants to create.

Content and layout

1. Intro banner - Simple page header with title, short mission statement, and image.
2. Brand story - One or two sections describing how the arena started and what makes it different.
3. Mission and values - Cards or short blocks for community, premium facilities, accessibility for beginners, and sportsmanship.
4. Team section - Optional profiles for founders, managers, coaches, or staff.
5. Why players choose this arena - Trust-building details such as maintenance quality, booking convenience, tournaments, or hospitality.
6. CTA strip - Book a court or contact us for partnerships/events.

Interactive behavior

- No complex interactions required beyond CTA buttons and possible team carousel on mobile.
- If team data is managed from admin, profiles should be fetched from a simple content model; otherwise static content is acceptable in this phase.

Data requirements

- about page content blocks, static assets, team profiles if dynamic

Implementation notes

- Keep copy authentic and concise. Avoid long walls of text.
- This page should feel human and local, not corporate or generic.

Acceptance criteria

- Page communicates brand story clearly and includes at least one conversion CTA.
- Images and copy adapt cleanly to mobile stacking.

8. Page Specification - Courts / Facilities (/courts)

Purpose

The Courts page is the product-detail page for the venue. It must explain the playing environment, what types of courts exist, and which amenities are available.

Content and layout

1. Page header - Title, short description, and CTA to booking page.
2. Court cards or court sections - Each court or court type should show name, type, surface, indoor/outdoor, image gallery, and key features.
3. Facility amenities - List or icon grid for parking, showers, lounge, cafe, rental gear, lighting, lockers, etc.
4. Operating hours and rules - Opening times and short player rules or etiquette.
5. Rental and extras note - Short section on racket rental, balls, coaching add-ons, or refreshments if offered.
6. Final CTA - Book this court or check live availability.

Interactive behavior

- Court image carousel opens full-size images if multiple images exist.
- Book button on each court card deep-links into /booking with the selected court prefilled.
- If some courts are temporarily unavailable long-term, show them but label as unavailable if the business wants visibility, otherwise hide inactive courts from public pages.

Data requirements

- courts, court_images, amenities from features_json or separate config
- site settings for operating hours and rules

Implementation notes

- Design this page visually; players often decide based on images and facility quality.
- Court naming must be consistent across Booking and Admin pages.

Acceptance criteria

- User can understand the difference between available court options.
- Each visible court has a working path to booking.

9. Page Specification - Booking (/booking)

Purpose

This is the most important functional page. The booking page must allow a user to search availability, select a slot, review price, and confirm a booking with minimal friction.

Content and layout

1. Page header and search controls - Date, approximate time, duration, court type, indoor/outdoor filter, player count if relevant.
2. Availability results area - A grid, list, or schedule view showing available courts and slots for the selected filters.
3. Slot card or availability row - Court name, slot start/end, court tags, price, and Select button.
4. Booking summary panel - Sticky summary showing selected court, date, duration, add-ons, subtotal, taxes/fees if any, and total.
5. Customer details step - Login prompt, account sign-in, or guest details form depending on configuration.
6. Payment or reservation step - Online payment or reserve-now confirmation depending on business mode.
7. Success screen - Booking code, date/time, court details, contact info, and next-step actions.

Interactive behavior

- Changing filters triggers an availability query.
- Selecting a slot updates the summary panel immediately.
- Add-ons must update total in real time on the client, then be revalidated on the server.
- On submit, backend creates a temporary hold or pending booking before payment is finalized.

- On success, show confirmation page and send email confirmation; WhatsApp or SMS is optional if integrated.
- Allow deep links from homepage or courts page to prefill date, time, or court filters.

Data requirements

- active courts
- pricing_rules
- existing bookings for the selected date
- blocked_slots
- site settings for booking window, cancellation policy, payment mode, guest booking setting
- optional add-on catalog

Implementation notes

- The page must handle loading, no results, server errors, and expired checkout hold states.
- Do not expose admin-only data such as blocked-slot reasons to public users.
- Consider separating the UI into Search panel, Results list, Summary card, and Checkout drawer/modal on mobile.

Acceptance criteria

- User can complete a booking end-to-end.
- Unavailable or overlapping slots can never be booked.
- Total price shown at confirmation matches server-calculated total.
- Booking page works cleanly on mobile without horizontal overflow.

9.1 Booking flow - detailed sequence

1. User lands on /booking directly or from a prefilled CTA.
2. Frontend loads active courts and default availability for a selected date.
3. User changes filters; frontend requests server-side availability.
4. User selects an available slot; frontend stores provisional choice in local state.
5. User optionally selects add-ons.
6. If user is not authenticated and guest booking is disabled, prompt login or sign-up before continuing.

7. User confirms contact details and billing details if needed.

8. Frontend submits booking intent to server.

9. Server validates slot still available, calculates final total, creates hold or pending booking, and returns payment session or confirmation object.

10. If payment is required, user completes payment and is redirected back.

11. Server marks booking confirmed when payment webhook or success callback completes.

12. Success page shows booking details and follow-up instructions.

9.2 Availability query contract

Input	Description
date	Required booking date
duration_mins	Requested duration, for example 60 or 90
court_type	Optional filter such as standard or premium
indoor_outdoor	Optional filter
start_after	Optional approximate earliest start time

Suggested output per slot result:

- court_id, court_name
- start_time, end_time
- display_price, currency
- tags such as indoor, panoramic, beginner-friendly
- availability_status = available or unavailable

10. Page Specification - Pricing (/pricing)

Purpose

The Pricing page answers the most common pre-booking question: how much does it cost. It must be easy to scan and must reflect how prices vary by day, time, duration, or court type.

Content and layout

1. Page header - Title, short explanation, and note that final price is confirmed at checkout if dynamic rules apply.

2. Main pricing table - Organize by weekday/weekend, peak/off-peak, or court type depending on business model.

3. Add-ons and rentals - Show optional racket rental, balls, coaching add-ons, etc.

4. Packages or promos - Optional cards for bulk sessions, off-peak specials, or introductory offers.

5. Policy notes - Cancellation, reschedule, lateness, and no-show notes.

6. CTA strip - Book now from pricing page.

Interactive behavior

- Pricing content can be generated from pricing_rules and rendered into grouped human-readable sections.
- If many rules exist, filter or tab them for usability instead of showing one huge raw table.

Data requirements

- pricing_rules, add-on list, policy text from site settings

Implementation notes

- Never hide pricing if the business wants conversion. Transparency improves booking confidence.
- If prices are seasonal, include valid-from dates in the admin model later.

Acceptance criteria

- User can understand the common booking prices without contacting support.
- Price labels are readable on mobile and do not overflow.

11. Page Specification - Tournaments / Events (/events)

Purpose

This page builds community and markets special activities. It should promote upcoming events and allow admins to manage event content easily.

Content and layout

1. Page header - Title and short explanation of events offered.

2. Upcoming events list - Cards with image, title, date, time, short summary, and CTA.

3. Past events archive or gallery - Optional section for recent completed events.

4. Event detail modal or detail page - Description, schedule, registration link, location, skill level, entry fee if any.

5. CTA to contact - For partnerships, sponsorships, or private tournaments.

Interactive behavior

- Default sort by nearest upcoming published event.
- Past events should be visually separated from upcoming ones.
- Event CTA can link to external registration forms if direct internal event registration is not in scope.

Data requirements

- events table with published status and date-time fields

Implementation notes

- Avoid using the events page as a dumping ground. Highlight quality upcoming items only.
- If there are no active events, show an empty state and CTA to contact for private bookings.

Acceptance criteria

- Upcoming events show correct dates and clear status.
- Page does not look broken when there are zero events.

12. Page Specification - Contact Us (/contact)

Purpose

The contact page exists for questions, private bookings, partnerships, and location clarity. It should reduce friction for people who prefer direct contact over self-service booking.

Content and layout

1. Page header - Title, short support message, and one or two quick contact CTAs.

2. Contact cards - Phone, WhatsApp, email, and opening hours.

3. Map and address - Embedded map or map link with exact venue location.

4. Contact form - Name, email, phone optional/required by business rule, subject, message.

5. Business inquiries note - Short text for corporate, school, or partnership requests.

6. Secondary CTA - Book a court if the inquiry is simply about playing.

Interactive behavior

- WhatsApp CTA should use direct click-to-chat if available.
- Contact form writes to contact_messages and optionally sends admin notification email.
- On successful submission show confirmation message and clear next-step expectation.

Data requirements

- site_settings for contact data and hours
- contact_messages table

Implementation notes

- Keep the form short. Most users should finish it in under a minute.
- Protect the form with spam mitigation such as captcha or server-side heuristics.

Acceptance criteria

- A visitor can immediately find the address and at least two contact methods.
- Form submission stores the inquiry and shows a success state.

13. Page Specification - FAQ (/faq)

Purpose

The FAQ page reduces repetitive support load and improves conversion by answering doubts before the user abandons the booking process.

Content and layout

1. Page header - Title and short intro.

2. Category filters - Optional tabs like Booking, Pricing, Facilities, Rules, Events.

3. Accordion list - Question as header, answer as expandable body.

4. Need more help strip - Link to Contact page or WhatsApp.

Interactive behavior

- Accordion should support keyboard navigation and one or multiple open items depending on implementation choice.
- Allow optional search input if there are many items.
- Only active FAQ items should display publicly.

Data requirements

- faq_items table or CMS-backed FAQ content

Implementation notes

- Seed the FAQ with real questions related to booking, cancellation, rentals, attire, and player count.
- Answers should be plain and practical, not legalistic.

Acceptance criteria

- A user can find answers quickly by category or scanning question titles.
- Admin can reorder FAQ items without code changes.

14. Page Specification - User Account / My Bookings (/account, /account/bookings)

Purpose

The account area gives customers a self-service space to view upcoming bookings, manage profile details, and review booking history.

Content and layout

1. Account overview - User greeting, upcoming bookings summary, quick actions, and profile snippet.
2. My bookings list - Upcoming and past bookings in separate sections or tabs.
3. Booking detail view - Court, date, time, add-ons, payment status, booking status, cancellation policy, and actions.
4. Profile settings - Name, phone, password change, communication preferences if supported.
5. Empty states - No upcoming bookings, no history, not signed in.

Interactive behavior

- Upcoming bookings sorted nearest-first.
- If cancellation or reschedule is allowed, show the action only when the policy window permits it.
- Cancelling a booking should ask for confirmation and clearly state any refund effect.
- Rescheduling may be implemented as cancel-and-rebook in v1 if true reschedule logic is not built yet; this must be clearly communicated to the user.

Data requirements

- current authenticated user
- bookings filtered by user_id
- booking_addons
- policy settings

Implementation notes

- This area must feel trustworthy and private. Use clear status badges and timestamps.

- Do not mix admin controls into customer pages.

Acceptance criteria

- Authenticated user can see only their own bookings.
- Upcoming bookings and booking history are clearly separated.
- Policy-based actions are enforced correctly.

15. Page Specification - Admin Dashboard (/admin and child routes)

Purpose

The admin dashboard is the operations center. It must allow non-technical staff to manage the business data that powers the public pages and booking flow.

Content and layout

1. Dashboard overview - Summary cards for today bookings, upcoming bookings, occupancy, unread contact messages, and upcoming events.
2. Bookings manager - Calendar or table view to inspect, create, edit, cancel, or mark booking status.
3. Courts manager - Manage court records, images, active state, display order, and features.
4. Availability manager - Create blocked slots for maintenance, private use, or closures.
5. Pricing manager - Create and edit pricing rules, add-ons, and policy notes.
6. Events manager - Create draft/published events and manage images, dates, summaries, and external registration links.
7. FAQ manager - Create, edit, reorder, activate/deactivate FAQ items.
8. Contact inbox - View contact messages, mark status, and optionally archive or mark responded.
9. Settings - Update contact details, hours, homepage snippets, booking policies, guest booking mode, and payment mode.

Interactive behavior

- Every write operation must show success and error feedback.
- List pages should support search, filtering, pagination, or basic date filters where relevant.
- Admin should be able to create a manual booking for walk-ins or phone bookings.
- Blocked slots should be visible in availability management and considered immediately by booking calculations.
- Use confirmation modals for destructive actions such as deleting or cancelling records.

Data requirements

- All operational entities listed in the data model
- admin-only analytics summary queries

Implementation notes

- Design admin for speed and clarity, not visual marketing polish.
- Use badges, filters, and status chips heavily to reduce mistakes.
- Record created_at and updated_at on mutable tables to aid auditing.

Acceptance criteria

- Admin can manage the full booking inventory without database access.
- Changes in admin are reflected on public pages and booking availability correctly.
- Non-admin users cannot access admin routes.

15.1 Admin child routes

Route	Purpose
/admin	Overview and KPIs
/admin/bookings	Manage all bookings and manual reservations
/admin/courts	Manage courts and court media
/admin/availability	Manage blocked slots and closures
/admin/pricing	Manage rate rules, add-ons, and policy text
/admin/events	Manage tournaments/events
/admin/faq	Manage FAQs
/admin/messages	View contact messages
/admin/settings	Business settings and public-facing snippets

16. API Contract - Suggested Endpoints

The exact API structure may vary, but the following endpoints are recommended because they map well to the selected pages and keep the system understandable.

Method	Endpoint	Description
GET	/api/public/home	Homepage content + featured data

Method	Endpoint	Description
GET	/api/courts	List active public courts
GET	/api/pricing	Return grouped public pricing data
GET	/api/events	List public published events
GET	/api/faq	List active FAQ items
POST	/api/contact	Submit contact form
GET	/api/availability	Return available slots for search filters
POST	/api/bookings	Create booking intent / hold / pending booking
POST	/api/bookings/:id/confirm	Confirm booking after payment or manual reserve flow
GET	/api/account/bookings	Return current user bookings
POST	/api/account/bookings/:id/cancel	Customer cancellation within allowed policy

Method	Endpoint	Description
GET	/api/admin/dashboard	Overview KPIs
GET	/api/admin/bookings	List all bookings
POST	/api/admin/bookings	Create manual booking
PATCH	/api/admin/bookings/:id	Edit booking status or details
GET	/api/admin/courts	List all courts
POST	/api/admin/courts	Create court
PATCH	/api/admin/courts/:id	Update court
GET	/api/admin/availability	List blocked slots
POST	/api/admin/availability	Create blocked slot
GET	/api/admin/pricing	List pricing rules
POST	/api/admin/pricing	Create pricing rule
GET	/api/admin/events	List events
POST	/api/admin/events	Create event

Method	Endpoint	Description
GET	/api/admin/faq	List FAQ items
POST	/api/admin/faq	Create FAQ item
GET	/api/admin/messages	List contact messages
PATCH	/api/admin/messages/:id	Update message status
GET	/api/admin/settings	Get business settings
PATCH	/api/admin/settings	Update business settings

17. Validation, States, and Error Handling

Form validation

- Email fields must validate format.
- Phone validation can be lightweight but should reject clearly invalid input.
- Date and time inputs must reject past times where not allowed.
- Required fields must show inline validation with readable messages.
- Server-side validation messages should map cleanly into the UI.

Required UI states

- Loading skeletons for availability results and admin tables
- No-results state on booking search with suggestion to change filters
- Empty account state when user has no bookings
- 404/not-found behavior for invalid event slugs or admin records
- Permission denied state for users hitting admin pages without access
- Checkout hold expired state if payment takes too long

Notifications and feedback

- Use toast or inline banners for saved changes, cancelled bookings, created events, and message submission success.
- For destructive actions, ask for explicit confirmation.
- For booking success, show a full success page rather than only a toast.

18. SEO and Marketing Requirements

- Public pages must include unique page titles and meta descriptions.
- Use structured content for local business info if possible.
- Use readable URLs: /about, /courts, /pricing, /events, /contact, /faq.
- Use alt text for important images.
- Event pages or event detail views should include date and location in metadata.

19. Testing and Acceptance Checklist

Area	Must pass
Public pages	All public routes load, are mobile responsive, and include working CTAs.
Booking search	Availability changes correctly when date or filters change.
Double-book prevention	Two users cannot successfully confirm the same court/time overlap.
Customer account	Customer sees only their own bookings.
Admin authorization	Non-admin access to /admin is blocked.
Pricing accuracy	Displayed checkout total equals server-calculated total.
Cancellation policy	Cancellation action appears only when allowed and updates status correctly.
Contact form	Submission is stored and visible to admin.
FAQ visibility	Inactive FAQ items do not appear publicly.
Event publishing	Draft events are hidden from public routes; published ones are visible.

20. Recommended Build Order for Codex

1. Set up project shell: routing, shared layout, auth scaffold, database schema, seed data.

2. Implement public marketing pages with static/dynamic placeholders: Home, About, Courts, Pricing, Contact, FAQ, Events.

3. Implement booking availability engine and booking page without payment first.

4. Implement authentication and account pages.
5. Implement admin dashboard modules for courts, blocked slots, pricing, events, FAQ, messages, and settings.
6. Integrate payment flow if enabled.
7. Perform end-to-end testing and polish responsive behavior.

21. Final Implementation Notes for Codex

- Prioritize correctness of booking logic over visual effects.
- Use reusable domain types for Court, PricingRule, Booking, Event, FAQItem, and ContactMessage.
- Keep public and admin UIs separate but powered by the same underlying data model.
- Build with clean empty states and realistic seed data so the product can be previewed immediately.
- When unsure, optimize for fewer user steps and clearer status visibility.

Definition of done
This phase is complete when the ten selected pages exist, are connected by working navigation, the booking flow works end-to-end with server validation, customers can manage their own bookings, and admins can manage the business data without touching code.
